

## Core Content

<b>Cluster Title: Perform operations with multi-digit whole numbers and with decimals to hundredths.</b>
<b>Standard 6:</b> Find whole-number quotients of whole numbers with up to four-digit dividends and two-digit divisors, using strategies based on place value, the properties of operations, and/or the relationship between multiplication and division. Illustrate and explain the calculation by using equations, rectangular arrays, and/or area models.
<b>MASTERY Patterns of Reasoning:</b>
<b>Conceptual:</b> Students will understand that multi-digit division is related to single-digit division in that it involves grouping (quotative model) or fair share (partitive model). Students will understand that multiplication and division are inverse operations.
<b>Procedural:</b> Students can calculate whole-number quotients of whole numbers with up to four-digit dividends and two-digit divisors. Students can explain the calculation. Students can use a variety of procedures for dividing whole numbers. (For example, lucky 7, standard algorithm, partial quotient, etc.)
<b>Representational:</b> Students can illustrate division using equations, rectangular arrays, and area models.

## Supports for Teachers

<b>Critical Background Knowledge</b>
<b>Conceptual:</b> Students will understand properties of operations. For example, commutative, associative, identity, etc. Students will understand both quotative and partitive division. Students will understand the significance of place value.

<p><b>Procedural:</b>                  Students can regroup with subtraction.                  Students can find the whole-number quotient of whole numbers with up to four-digit dividends and one-digit divisors.</p> <p><b>Representational:</b>                  Students will model simple division with arrays.                  Students will model both quotative and partitive division using arrays and area models (4.NBT.6).</p>	
<p><b>Academic Vocabulary and Notation</b></p>	
<p>dividend, divisor, quotient, area model, partitive, quotative, arrays, division notation (<math>\frac{a}{b}</math>, <math>a/b</math>, <math>a \div b</math>, <math>b \overline{)a}</math> )</p>	
<p><b>Instructional Strategies Used</b></p>	
<p>When instructing on the use of the traditional algorithm for long division, make sure that place value is expressly provided. For example, in the problem <math>324 \div 27</math> set up as</p> $27 \overline{)324}$ <p>do not ask, “How many times does 27 go into 3?” when it is 3 hundred. Instead of asking how many times 27 goes into 32, ask “How many 27’s are there in 32 tens?”</p> <p>Use more than one method for dividing, such as partial quotients, lucky 7 and arrays. Work toward linking these strategies to the standard algorithm.</p>	<p><b>Resources Used</b></p>
<p>Common Core State Standards document page 89 “Common Multiplication and Division Situations”</p> <p>Understanding Division (Section 2):  <a href="http://www.conceptualstudy.org/ElementaryMath/Understanding%20Division.htm">http://www.conceptualstudy.org/Elementary Math/Understanding Division.htm</a></p>	
<p><b>Assessment Tasks Used</b></p>	
<p><b>Skill-Based Task:</b>                  Divide the following and show your work.  <math>14 \overline{)588}</math></p>	<p><b>Problem Task:</b>                  Samantha wants to split a collection of stickers into groups of 48. Samantha has 1,008 stickers. How many groups will be created? Show two ways to find the answer.</p>
